## **Lab#1: Basic Statistical Descriptions**

Date of the Session: \_\_\_\_/\_\_\_\_/\_\_\_\_

Time of the Session \_\_\_\_ to \_\_\_\_

### **Pre-lab**

#### *BASIC STATISTICAL DESCRIPTIONS OF DATA*

*Basic statistical descriptions provide the analytical foundation for data pre processing. It can be used to identify properties of the data and highlight which data values should be treated as noisy or outliers.*

*Answer the following Questions*

*1. What are the various ways to measure the central tendency of data?*

*2. What are the several ways of measuring the dispersion of data?*

*3. What is IQR (inter quartile range)?*

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

4. Observe the following diagrams; identify the quantile and q-q plot? Define how the q-q-plot is different from quantile plot?

5. What are the items involved Five number summary?

6. Identify the symmetric data , positively skewed data and negatively skewed data from the below graphs?

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

### In-lab

1. Given a dataset “cars” for analysis it includes the variables speed and distance.(Download the dataset from lms)
  - a) What are the average speed and the distance of the cars?
  - b) What is the median and midrange of the data?
  - c) Find mode of the data and comment on the data modality (i.e, unimodal or bimodal)?
  - d) What are the variance and the standard deviation of the data?
  - e) Find the five number summaries of the data?
  - f) Show the histogram and box plot of the data?

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

**Writing space of the Problem :( For Student’s use only)**

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

### Post-lab

1. Suppose that a hospital tested the age and body fat data for 18 randomly selected adults with the following results. (Download the dataset from lms)

- Find the maximum and the minimum percentage of the fat and age of the adults who visited the hospital.
- Calculate mean, median and midrange of the age.
- Find the first quartile and third quartile of the data.
- Draw a scatter plot and q-q plot based on these two variables.

**Writing space of the Problem: (For Student's use only)**

Course Title	Data Warehousing and Mining	ACADEMIC YEAR: 2024-25
Course Code(s)	22AD3104A	Page 5 of 71

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

VivaVoce:-

1. Difference between symmetric data and skewed data.
2. What are the most widely used forms of quartiles?
3. Variance and Standard deviation fall under what category of measuring data?
4. What do low and high standard deviations indicate?
5. Based on what condition, two variables are said to be correlated?

*(For Evaluator's use only)*

<u>Comment of the Evaluator (if Any)</u>     	<u>Evaluator's Observation</u> Marks Secured: _____ out of _____  Full Name of the Evaluator:   Signature of the Evaluator      Date of Evaluation:

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

## Lab#2: To implement data pre-processing techniques.

Date of the Session: \_\_\_\_/\_\_\_\_/\_\_\_\_ Time of the Session \_\_\_\_\_ to \_\_\_\_\_

### Pre Lab

#### DATA PREPROCESSING:

Databases are exceedingly helpless to noisy, missing, and inconsistent data because of their commonly enormous size (frequently a few gigabytes or more). Low-quality information will prompt low-quality mining results. Pre-processing helps to get a quality data. The steps involved in data pre-processing are data cleaning, data integration, data reduction, data transformation.

Match the following:

- |                             |  |
|-----------------------------|--|
| i. Data cleaning            | a. Reduced representation of data                        |
| ii. Data integration        | b. $X_{old} / X_{max}$                                   |
| iii. Data reduction         | c. deal with missing values and noisy data               |
| iv. Normalization           | d. works to remove noisy data                            |
| v. Data transformation      | e. $(X_{old} - X_{min}) / (X_{max} - X_{min})$           |
| vi. Decimal scaling         | f. merging of data from multiple data stores             |
| vii. Minmax normalization   | g. scale the data values in specified range              |
| viii. Z score normalization | h. convert data into appropriate forms                   |
| ix. Smoothing               | i. $(x_{old} - \text{mean}) / \text{standard deviation}$ |

1. Mention any two methods that deal with missing values and noisy data.
2. Mention two techniques that are applied to obtain a reduced dataset.
3. Using min-max normalization, transform the value 35 onto the range [0.0, 1.0].
4. Using z-score normalization, transform the value 35, where the standard deviation is 12.94 years.
5. Using normalization by decimal scaling, transform the value 35.

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

### In-lab

1. Given a data set “data” for analysis it includes the attribute Country, purchased item, age, Salary.

A	B	C	D
Country	Age	Salary	Purchased
France	44	72000	No
Spain	27	48000	Yes
Germany	30	54000	No
Spain	38	61000	No
Germany	40		Yes
France	35	58000	Yes
Spain		52000	No
France	48	79000	Yes
Germany	50	83000	No
France	37	67000	Yes

- Identify number of missing values in a given dataset
- Drop the tuples that have missing values in the attributes.
- Check the data type of age , if it is not an integer then convert into integer.
- Normalize the salary using simple feature scaling.
- Categorize the salary into low, high, medium bins.
- Turn the categorical values into numerical.

**Writing space of the Problem :( For Student’s use only)**

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

2. Suppose John is working as a manager at Nuclear Power Corporation of India and has been charged with analyzing the Nuclear power station construction data. He carefully inspects the company's database identifying and selecting the attributes (cost, date, t1, t2 and cap) to be included in the analysis. (Download the dataset from Ims)

- He noticed that several values of the attributes for various tuples have no recorded value.
- He observed that data type of year is recorded in float instead of integer type.
- He wants to normalize all the data (variables) in equal weights.
- Finally, he wants to know if there are any outliers present in cost of the construction. You immediately set out to perform this task.

**Hint:** missing values can be solved by replacing with mean)

Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

### Post-lab

1. Data(13,5,16,16,19,20,20,21,22,22,25,25,25,25,30,33,33,35,35,35,35,36,40,45,46,52,70)
2. Use smoothing by bin means to smooth the above data, using a bin depth of
3. Illustrate your steps.

*Comment on the effect of this technique for the given data. Also Plot a histogram.*

**Writing space of the Problem :( For Student's use only)**

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

2. Use these two methods below to normalize the following group of data: 200, 300, 400,600and1000.

- a. min-max normalization by setting min =0 and max=1
- b. z-score normalization
- c. z-score normalization using the mean absolute deviation of standard deviation
- d. Normalization by simple feature scaling.

**Writing space of the Problem :( For Student's use only)**

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

- 3.a. Normalize the two variables(age, fat) based on z-score normalization  
b. Calculate the correlation matrix. Are these two variables positively or negatively correlated?

	Age	Fat
0	23	9.5
1	23	26.5
2	27	7.6
3	27	17.8
4	39	31.4
5	41	25.9
6	47	27.4
7	49	27.2
8	50	31.2

**Writing space of the Problem :( For Student's use only)**

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

VivaVoce:-

1. What are the factors that comprising data quality?
2. What do you mean by noise in the dataset?
3. What are outliers in the dataset?
4. What is discretization?
5. What is the difference between lossy and lossless in data reduction?

*(For Evaluator's use only)*

<u>Comment of the Evaluator (if Any)</u>	<u>Evaluator's Observation</u> Marks Secured: _____ out of _____  Full Name of the Evaluator: _____  Signature of the Evaluator Date of Evaluation: _____

Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

### Lab#3: To implement principle component analysis

Date of the Session: \_\_\_\_/\_\_\_\_/\_\_\_\_

Time of the Session \_\_\_\_ to \_\_\_\_

#### Pre-lab:-

#### Principal Component Analysis:

*Principal Component Analysis is a method of extracting important variables from large set of variables available in a dataset. Suppose that the data to be reduced consist of tuples or data vectors described by  $n$  attributes or dimensions. Principal components analysis (PCA; also called the Karhunen-Loeve, or K-L, method) searches for  $k$   $n$ -dimensional orthogonal vectors that can best be used to represent the data, where  $k \leq n$ . The original data are thus projected onto a much smaller space, resulting in dimensionality reduction.*

1. What are principal components?
2. Mention the steps to construct principal components?

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

In-lab:-

1. Suppose that you are given a small 3x2 matrix, you have to calculate Principal Component Analysis without using `pca()` function?  
Matrix :([3, 5], [4, 2], [1, 6])

**Writing space of the Problem :( For Student's use only)**

2. Calculate the principal component analysis for the matrix given in Q1 using PCA?

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

Post-lab:-

1. *The Iris dataset is a classic dataset in statistics, often used for testing and benchmarking algorithms. How does Principal Component Analysis (PCA) transform the high-dimensional Iris dataset into a lower-dimensional space, and what can be inferred about the dataset from the visual representation of the first two principal components?  
(Download the dataset from lms )*

**Writing space of the Problem :( For Student's use only)**

### Lab#4: Classification using Decision Trees.

Date of the Session: \_\_\_\_\_/\_\_\_\_/\_\_\_\_

Time of the Session: \_\_\_\_to\_\_\_\_

#### Pre-lab:-

1. What are the attribute selection measures in modelling a decision tree and write the respective equations for each of them.
2. What do you mean by entropy in a decision tree? How is it calculated?
3. What is Information gain and how does it matter in a Decision Tree?
4. List out the parameters involved in Decision Tree Classifier and export\_graphviz and try to understand the role of each parameter.

5. Match the following:

1. ID3
2. CART
3. C4.5

- a. GAIN RATIO
- b. INFORMATION GAIN
- c. GINI INDEX

Course Title	Data Warehousing and Mining	ACADEMIC YEAR: 2024-25
Course Code(s)	22AD3104A	Page 18 of 71

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

In-lab:-

1. Implement the decision tree algorithm on the given data which has weight and smoothness as the segregating criteria for the fruit apple and orange. Apple is represented by the number '1' and orange by '0'. Construct a decision tree and apply the prediction measures for the given data to obtain the types of fruits.

Weight	Smooth	Fruit
180	7	?
140	8	?
150	5	?

Weight (grams)	Smooth (Range of 1 to 10)	Fruit
170	9	1
175	10	1
180	8	1
178	8	1
182	7	1
130	3	0
120	4	0
130	2	0
138	5	0
145	6	0

Fruit dataset

<https://drive.google.com/file/d/1qoMDjzHHELVn5tFAJxp8mMw0Ggt-BVX/view?usp=sharing>

Convert the trained decision tree classifier into graphviz object. Later; we use the converted graphviz object for visualization. To visualize the decision tree, you just need to open the .txt file and copy the contents of the file to paste in the graphviz web portal graphviz web portal address: <http://webgraphviz.com>

**Writing space of the Problem :( For Student's use only)**

Course Title	Data Warehousing and Mining	ACADEMIC YEAR: 2024-25
Course Code(s)	22AD3104A	Page 19 of 71

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

2. Below given is the diabetes dataset.

(Ref: [https://drive.google.com/file/d/1PJzP39JPh\\_T-5dQVcUVCfswrPSxT734/view?usp=sharing](https://drive.google.com/file/d/1PJzP39JPh_T-5dQVcUVCfswrPSxT734/view?usp=sharing))

Make sure to install the scikit-learn package and other required packages.

1. Find the correlation matrix for the diabetes dataset?
  1. Split the dataset into train\_set and test\_set for modeling and prediction. Divide the dataset in such a way that the trained dataset constitutes 70 percent of the original dataset and the rest of the part belongs to the test dataset.
  2. Produce a decision tree model using
    - a. Gini index metric
    - b. Entropy and Information gain metric on the trained dataset using the Decision Tree Classifier function.
  3. Apply the prediction measures on the test dataset.
  4. Define a function named accuracy\_score by interpreting the difference between the predicted values and the test set values.
  5. Display the accuracy in terms of
    - a) using the accuracy\_score function
    - b) Fraction Number of correct predictions.
    - c) Print the confusion matrix of the test dataset.
  6. Calculate the following values manually after obtaining the confusion matrix
    - a. Accuracy
    - b. Error rate
    - c. Precision
    - d. Recall (sensitivity)
    - e. F1Score
    - f. Specificity
- Compare the two results (obtained from two kinds of metrics) and state which method is more accurate for this dataset. Convert the trained decision tree classifier into graphviz object. Later, we use the converted graphviz object for visualization.

10. Plot ROC curve and calculate AUC

11. Plot recall vs precision curve

**Writing space of the Problem :( For Student's use only)**

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

Post-lab:-

1. What is the C4.5 algorithm and how does it work? State the differences between ID3 and C4.5.
2. Differentiate between over-fitting, over-fitting and over-fitting loss? Why does it occur during classification?
3. Explain the concept to fpruning and why it is important. Differentiate between pre-pruning and post-pruning.

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

VivaVoce:-

1. What is the difference between supervised and unsupervised machine learning?
2. What is a confusion matrix?
3. Which of the following is true about training and testing error in such case?
  - a. The difference between training error and tester or increases as number of observations increase.
  - b. The difference between training error and test error decreases as number of observations increase.
  - c. The difference between training error and test error will not change
4. What is the difference between classification and clustering?
5. What are Recommender Systems?

( For Evaluator's use only )

<u>Comment of the Evaluator (if Any)</u>	<u>Evaluator's Observation</u> Marks Secured: _____ out of _____  Full Name of the Evaluator: _____  Signature of the Evaluator Date of Evaluation: _____

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

•

3. *Write an algorithm for k-nearest-neighbor classification given  $k$ , the nearest number of neighbors, and  $n$ , the number of attributes describing each tuple.*

4. *Compare the advantages and disadvantages of eager classification (e.g., decision tree, Bayesian, neural network) versus lazy classification (e.g., k-nearest-neighbor, case-based reasoning).*

5. *Give the distance methods that are most commonly used in k-nearest-neighbor algorithm.*

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

### In-lab:-

Perform the following Analysis:

Step-by-step process to compute k-nearest-neighbor algorithm is:

1. Determine parameter k=no. of nearest neighbors
2. Calculate the distance between the test sample and the training samples.
3. Sort the distance and determine nearest neighbors based on the  $k^{\text{th}}$  minimum distance.
4. Gather the category of nearest neighbors.
5. Use simple majority of the category of nearest neighbors as the prediction value of testing sample.

Dataset:

Suppose we have the following “**Student Data Set**” dataset which consists of 1<sup>st</sup> year CGPA, 2<sup>nd</sup> year CGPA, Category(C: CRT, NC: Non-CRT) as parameters.

Std.No	1 <sup>st</sup> year CG PA	2 <sup>nd</sup> year CGPA	Category
1	8.5	8.5	C
2	8.2	9	C
3	7.5	7.6	C
4	5.5	4.5	NC
5	9.2	9	C
6	7.8	7.3	C
7	7.3	7.4	NC
8	7.9	7	NC
9	10	6	C
10	6.8	7.1	NC
11	6.5	7.1	NC
12	7.2	7.3	NC

When a new student comes only with 1<sup>st</sup> year CGPA and 2<sup>nd</sup> year CGPA as information predict the category of that new student (whether he belongs to CRT or Non-CRT) by Euclidean distance measure, where Euclidean distance between 2 points or tuples, say  $X_1 = (x_{11}, x_{12}, \dots, x_{1n})$  and  $X_2 = (x_{21}, x_{22}, \dots, x_{2n})$ , is

$$\text{dist}(X_1, X_2) = \sqrt{\sum_{i=1}^n (x_{1i} - x_{2i})^2}$$

Tests ample:

1<sup>st</sup> year CGPA and 2<sup>nd</sup> year CGPA of the new student are 8.4 and 7.1 respectively.  
(Consider k=3)

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

**Writing space of the Problem: (For Student’s use only)**

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

Post-lab:-

1. Predict the Category of student with **1<sup>st</sup> year CGPA and 2<sup>nd</sup> year CGPA as 7.3 and 7.1 respectively** using the Manhattan measuring technique formula with  $k=3$  **(Manually)**.  
Note: The Manhattan distance between two tuples (or points)  $a$  and  $b$  is defined as  $\sum |a_i - b_i|$
2. By considering the above **Student Data Set** ,, predict the Category of the new student having **1<sup>st</sup> year CGPA and 2<sup>nd</sup> year CGPA as 8.4 and 7.1 respectively**, by implementing the python code using Manhattan distance measure in order to find nearest neighbors for  $k=3$  and check whether the output is same for both the measuring techniques or not.

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

VivaVoce:-

Refer Page no: 423 ,424, 425 in Han J & Kamber M, "Data Mining: Concepts and Techniques", Third Edition, Elsevier, 2011

1. *k*-nearest-neighbor is a \_\_\_\_\_ lazy learning algorithm.
2. How can the distance be computed for attributes that are not numeric, but nominal (or categorical) such as color?
3. List some techniques used to speed up the classification time.
4. If the value of a given attribute *A* is missing in tuple  $X_1$  and/or in tuple  $X_2$ , the difference is always \_\_\_\_\_

(For Evaluator's use only )

<u>Comment of the Evaluator (if Any)</u>	<u>Evaluator's Observation</u> Marks Secured: _____ out of _____  Full Name of the Evaluator:   Signature of the Evaluator Date of Evaluation:

## Lab #6: Classification using Bayesian Classifiers

**Date of the Session:** \_\_\_\_/\_\_\_\_/\_\_\_\_

**Time of the Session:** \_\_\_\_\_ to \_\_\_\_\_

### Pre-lab:-

1. Match the following

Column A	Column B
a. Naïve Bayesian Classification	a. Values are continuous
b. Bayesian belief network	b. Attributes condition all y dependent
c. Gaussian distribution	c. To avoid zero probability
d. Laplace estimator	d. Attributes condition all y independent

2. Explain Baye's theorem and write its derived formulae.

3. Suppose we have continuous values for an attribute in a data set then how to calculate probability.

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

4. Let us assume

$p(\text{age}=\text{youth}/\text{buys\_car}=\text{yes}) = 0.222$ ,

$p(\text{income}=\text{medium}/\text{buys\_car}) = 0.444$  and

$p(\text{buys\_car}=\text{yes}) = 0.643$  then

Find the probability of  $p(x/\text{buys\_car}=\text{yes})$ , where  $x = (\text{income}=\text{medium}, \text{age}=\text{youth})$ .

5. While implementing Naïve Bayesian classifier, suppose we have encountered a zero probability then we should add one count to each of the probability to avoid zero probability. What is this estimation is called?

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

In-lab:-

1. Consider the given table named “Weather\_cond.csv” consisting of attributes Temperature Humidity, Windy and a class label named “Outcome”. Depending on the weather conditions you have to choose whether to play cricket or not.

- Unlike conventional function, write a python function to split the dataset into training set and test set. Assume test size length as 0.33.
- Write a python function to calculate mean and standard deviation for each numerical attribute in the data set.
- Calculate the number of priors for the given data set after splitting into training and test sets using python.

**Writing space of the Problem: (For Student’s use only)**

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

2. The problem is comprised of 100 observations of medical details for Pima Indian's patients. The records describe instantaneous measurements taken from the patient such as their age, the number of times pregnant and blood workup. All patients are women aged 21 or older. All attributes are numeric, and their units vary from attribute to attribute. Each record has a class value that indicates whether the patient suffered an onset of diabetes within 5 years of when the measurements were taken (1) or not (0). This is a standard data set that has been studied a lot in machine learning literature. A good prediction accuracy is 70%-76%.

Implement a python code to find the accuracy for given data set named "Diabetes.csv" based on train set and test set. Take test size length as 0.4.

**Writing space of the Problem: (For Student's use only)**

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

Post-lab:-

1. Consider the given table that specifies loan classification problem.

<i>Tid</i>	<i>Home Owner</i>	<i>Marital status</i>	<i>Annual Income</i>	<i>Defaulted Borrower</i>
1	Yes	Single	125K	No
2	No	Married	100K	No
3	No	Single	70K	No
4	Yes	Married	120K	No
5	No	Divorced	95K	Yes
6	No	Married	60K	No
7	Yes	Divorced	220K	No
8	No	Single	85K	Yes
9	No	Married	75K	No
10	No	Single	90K	Yes

- Compute the class conditional probability for each categorical attribute.
- Predict the class label value for test record  $X = (\text{Home Owner}=\text{No}, \text{Marital Status}=\text{Married}, \text{Income}=\$120\text{K})$

**Writing space of the Problem: (For Student's use only)**

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

VivaVoce:-

1. Explain the difference between a Validation Set and a Test Set?
2. What are the three types of Naïve Bayes classifier?
3. How many terms are required for building a Bayes model?
4. What is training test and testing set?
5. What are the advantages of Naive Bayes?

## Lab #7: Classification using Back propagation

Date of the Session: \_\_\_\_/\_\_\_\_/\_\_\_\_

Time of the Session: \_\_\_\_ to \_\_\_\_

### Pre-lab:-

**In LMS: Find the file named “Han J & Kamber M, Data Mining Concepts and Techniques.doc”.**

*Read the specified document from Pg.No:398–404 and answer the below questions.*

1. State whether the given statement is True/False.

a. Back propagation is neural network learning algorithm.

b. Back propagation learns by iteratively processing a data set of training tuples, comparing the network’s prediction for each tuple with the actual known target value.

2. What is the objective of Back propagation?

3. Explain about Multilayer Feed-Forward Neural Network with diagram.

Course Title	Data Warehousing and Mining	ACADEMIC YEAR: 2024-25
Course Code(s)	22AD3104A	Page <b>36</b> of <b>71</b>

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

4. How does Back propagation work?

5. Consider the following table.

<i>Input</i>	<i>Desired Output</i>	<i>Model Output</i>	<i>Absolute Error</i>	<i>Square Error</i>
0	0			
1	2			
2	4			

Predict the Model Output by considering the initial value of weight as 3. Find the Absolute Error and Square Error. Use the Back propagation algorithm to update the weight and try to minimize the **square error** as much as possible.

*Hint:*

- i. **Model Output**=  $W * I(x)$  ( $W$ =weight,  $I$ =Input,  $x$ =index that iterates from 0 to length(Input))
- ii. **Absolute Error** =  $\text{mod}(\text{Model Output} - \text{Desired Output})$
- iii. **Square Error**=  $(\text{Absolute Error})^2$

**Writing space of the Problem: ( For Student's use only )**

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

### In-lab:-

#### Analysis:

The following steps will provide the foundation that you need to implement the Back propagation algorithm and apply it to your own predictive modeling problems:

1. Initialize Network.
2. Forward Propagate.
  - i. Neuron Activation.
  - ii. Neuron Transfer.
  - iii. Forward Propagation.
3. Back Propagate Error.
  - i. Transfer Derivative
  - ii. Error Back propagation
4. Train Network.
  - i. Update Weights.
  - ii. Train Network.
5. Test Network.

#### Dataset:

Suppose we have the following “**Results Dataset**” which consists of GPA’s of some students that they had scored in two internal tests. And, it also consists of another attribute named ‘Qualified’, which holds a character (Q/NQ), representing the student qualification for final examination.

S.No	Test– 1	Test– 2	Qualified
1	8.5	8.5	Q
2	8.2	9.0	Q
3	3.5	5.0	NQ
4	5.5	4.5	NQ
5	9.2	9.0	Q
6	7.8	7.3	Q
7	8.0	3.1	NQ
8	10	7.0	Q
9	4.5	6.0	NQ
10	6.8	7.1	Q
11	5.1	4.1	NQ
12	4.2	5.3	NQ

**Problem:** Train a network on above “**Results Dataset**” by applying Back propagation algorithm.

- a. Initializing a network with all weights and biases. (Consider weights in range-0.5 to +0.5, biases=1, Learning Rate = {0.5, 0.7, 1})
- b. Training the network according to the Dataset. (Consider both Activating Functions– Sigmoid Function and Tanh Function)
- c. Back propagating the errors.

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

*Post-lab:-*

1. Use the network which is trained on the above **“Results Dataset”** and test whether it is trained with 100% accuracy or not. And, predict the result (qualified for final examination or not) of a new entry which contains 5.9 and 5.9 GPA's of test-1 and test-2 respectively.

**Writing space of the Problem: (For Student's use only)**

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

VivaVoce:-

1. What are the general tasks that are performed with back propagation algorithm?
2. What kind of real-world problem can neural networks solve?
3. What is a gradient descent?
4. Why is zero initialization not a recommended weight initialization technique?
5. How are artificial neural networks different from normal networks?

(For Evaluator's use only )

## Lab#8: Association Rule Mining -Apriori

Date of the Session:\_\_\_\_\_/\_\_\_\_\_/\_\_\_\_Time of the Session:\_\_\_\_\_to\_\_\_\_\_

### Pre-lab:-

1. Define what is Apriori algorithm.

2. What is association mining?

3. What is the need of association mining?

4. What is minimum support and minimum confidence?

5. Consider the market basket transactions given in the following table.

Let min-sup=40%and min\_conf=40%

Transaction ID	Items Bought
T1	A,B,C
T2	A,B,C,D,E
T3	A,C,D
T4	A,C,D,E
T5	A,B,C,D

a. Find all the frequent item sets using apriori algorithm.

b. Obtain significant decision rules.

Course Title	Data Warehousing and Mining	ACADEMIC YEAR: 2024-25
Course Code(s)	22AD3104A	Page <b>42</b> of <b>71</b>

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

In-lab:- For the following given transaction dataset, perform following operations :

a. Generate rules using Apriori algorithm by using below dataset.

shrimp	almonds	avocado	vegetables mix	green grapes	whole wheat flour	yams	cottage cheese
burgers	meatballs	eggs					
chutney							
turkey	avocado						
mineral water	milk	energy bar	whole wheat rice	Green tea	eggs		
Low fat yogurt							
whole wheat pasta	french fries						
soup	light cream	shallot					
frozen vegetables	spaghetti	green tea					
french fries							
eggs	Pet food						
cookies							
turkey	burgers	mineral water	eggs	cooking oil			
spaghetti	champagne	cookies					
mineral water	salmon	eggs					
mineral water							
shrimp	chocolate	chicken	honey	oil	Cooking oil	Low fat yogurt	
turkey	eggs						
turkey	Fresh tuna	tomatoes	spaghetti	mineral water	Black tea	salmon	eggs
meatballs	milk	honey	french fries	Protein bar			
redwine	shrimp	pasta	pepper	eggs	chocolate	shampoo	
rice	sparkling water						
spaghetti	mineral water	ham	body spray	pancakes	Green tea		
burgers	grated cheese	eggs	pasta	avocado	honey	white wine	toothpaste
eggs

## Lab#9: Implementation of K-Means Clustering

**Date of the Session:** \_\_\_\_/\_\_\_\_/\_\_\_\_

**Time of the Session:** \_\_\_\_\_ to \_\_\_\_\_

### Pre-Requisites:

*Data pre-processing*

*Basics of plotting techniques*

*Various clustering techniques*

### Pre-lab:-

1. Match the following.

Parameters	Application
1. <i>pch</i>	a. <i>To set orientation of axis labels</i>
2. <i>col</i>	b. <i>No. of plots per row and column</i>
3. <i>mfrow</i>	c. <i>To set plot color</i>
4. <i>lwd</i>	d. <i>Plotting symbol</i>
5. <i>las</i>	e. <i>To set line width</i>

2. List out various parameters and attributes in KMeans clustering.

3. Into how many types does clustering divided into and name them.

4. List out various applications of clustering.

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

5. Describe Euclidean distance and Manhattan distance in brief with its derived formula.

6. List out basic steps involved in KMeans clustering.

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

In-lab:-

1. The given dataset comprises of 150 data entries of different countries around the world. It is a report on world happiness, a landmark survey of the state of global happiness that ranks 156 countries by how happy their citizens perceive themselves to be, with a focus on the technologies, social norms, conflicts and government policies that have driven those changes. The records contains various attributes of each country that includes positive\_effect, negative\_effect, corruption, freedom, health life expectancy etc. The data frame includes categorical variables, numerical values and their values vary from country to country.

Implement a python code using scikit-learn to display a K-means clustering plot for given dataframe named "world\_happiness\_report.csv".

**Writing space of the Problem: (For Student's use only )**

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

2. The given dataset named “Student\_performance” consists of 150 data entries of students in an institution that displays the performance of a student. It consists of various attributes such as gender, ethnicity, test\_preparation, math\_score, reading\_score etc. Perform the K means clustering for the given dataset taking an appropriate number of centres based on mean and standard deviation for the data entries. Analyze the cluster plot and give a brief note based on results obtained.

**Writing space of the Problem: ( For Student’s use only )**

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

### Post-lab:-

*1. This lab module aims to build an analysis on customers of a shopping mall. It consists of 150 observations of customers consisting details that include gender, age, annual\_income, spending\_score etc. Based on the two parameters annual\_income and spending\_score, try to build a analysis on customers through cluster graphs*

*Apply k means clustering on the given data set named “Mall\_customers” marking number of clusters based on mean and standard deviation of any two attributes of your choice and implement the K-means iteratively till the centroids get stabilized*

**Writing space of the Problem: (For Student’s use only)**

## Lab#10: Classification: Support Vector Machine (SVM)

**Date of the Session:** \_\_\_\_/\_\_\_\_/\_\_\_\_

**Time of the Session:** \_\_\_\_\_ to \_\_\_\_\_

### Pre-lab:-

1. What is SVM?

2. When do we use SVM?

3. What is maximum marginal hyper plane and what is the equation of separating hyperplane?

4. What are the two cases of SVM?

5. What are the equations for point that lies above these parating hyperplane and below these parating hyperplane?

Course Title	Data Warehousing and Mining	ACADEMIC YEAR: 2024-25
Course Code(s)	22AD3104A	Page <b>54</b> of <b>71</b>

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

### In-lab:-

1. Below is the data of the employees in the company. The data shows whether employee purchased software or not. Take x co-ordinate as age and y co-ordinate as estimated\_salary. Now, Consider the following dataset and perform the below operations:

User ID	Gender	Age	Estimated Salary	Purchased
15624510	Male	19	19000	0
15810944	Male	35	20000	0
15668575	Female	26	43000	0
15603246	Female	27	57000	0
15804002	Male	19	76000	0
15728773	Male	27	58000	0
15598044	Female	27	84000	0
15694829	Female	32	150000	1
15600575	Male	25	33000	0
15727311	Female	35	65000	0
15570769	Female	26	80000	0
15606274	Female	26	52000	0
15746139	Male	20	86000	0
15704987	Male	32	18000	0
15628972	Male	18	82000	0
15697686	Male	29	80000	0
15733883	Male	47	25000	1
15617482	Male	45	26000	1
15704583	Male	46	28000	1
15621083	Female	48	29000	1
15649487	Male	45	22000	1
15736760	Female	47	49000	1
15714658	Male	48	41000	1
15599081	Female	45	22000	1
15705113	Male	46	23000	1
15631159	Male	47	20000	1
15792818	Male	49	28000	1
15633531	Female	47	30000	1
15744529	Male	29	43000	0

- Import the data set into python
- Split the dataset set into training and testing sets
- Apply feature scaling on training and test sets
- Fit SVM to the training set
- Visualize the training set results
- Visualize the test set results.

## Lab#11: Rule Based Classification

Date of the Session: \_\_\_\_\_/\_\_\_\_\_/\_\_\_\_\_

Time of the Session: \_\_\_\_to\_\_\_\_

### Pre-requisite:

Refer Page no: 355-363 in Han J & Kamber M, "Data Mining: Concepts and Techniques", Third Edition, Elsevier, 2011

### Pre-lab:-

1. What is rule-based classification in data mining?
2. Briefly explain about the building classification rules.
3. When to stop building a rule?
4. List some aspects of sequential covering.
5. What are the characteristics of rule-based classifier?
6. Define coverage and accuracy.

Course Title	Data Warehousing and Mining	ACADEMIC YEAR: 2024-25
Course Code(s)	22AD3104A	Page 59 of 71

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

In-lab:-

1. Implement a simple python code for rule-based classification on “**All Electronics Customer**” database (Download the dataset from LMS)

RID	age	income	student	Credit_rating	Class:buys computer
1	youth	high	no	fair	no
2	youth	high	no	excellent	no
3	middle_aged	high	no	fair	yes
4	senior	medium	no	fair	yes
5	senior	low	yes	fair	yes
6	senior	low	yes	excellent	no
7	middle_aged	low	yes	excellent	yes
8	youth	medium	no	fair	no
9	youth	low	yes	fair	yes
10	senior	medium	yes	fair	yes
11	youth	medium	yes	excellent	yes
12	middle_aged	medium	no	excellent	yes
13	middle_aged	high	yes	fair	yes
14	senior	medium	no	excellent	no

- a. Calculate accuracy, coverage and print the RID values when the following rules are satisfied:
  - **Rule R1:** if the age of the person is in the category of “youth” and he/she is a student then the person purchases the computer.
  - **Rule R2:** if age of the person is in the category of “middle\_aged” , income is either medium or high and with excellent Credit\_rating then the person buys a computer
  - **RuleR3:** if age of the person is in the category of “senior” and he/she is a student then purchases a computer.
  - **Rule R4:** if age of the person is in the category of “senior” , income is high, he/she is a student and with Credit\_rating fair then purchases a computer.

**Writing space of the Problem: (For Student’s use only )**

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

Post-lab:-

1. Extract possible classification rules from the given decision tree.

2. Write the sequential covering algorithm used in rule induction.

3. Difference between Decision tree and rule based classification.

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

VivaVoce:-

1. Rule-Based classifier classifies records by using a collection of \_\_\_\_\_ rules.
2. Most rule-based classification systems use which strategy?
3. Difference between class-based ordering and rule-based ordering.
4. Briefly explain the below terms in your own words:
  - a. Mutually exclusive
  - b. Exhaustive
5. Name the terms that define the following statements:
  - a. Fraction of records that satisfy only antecedent of a rule.
  - b. Fraction of records that satisfy both antecedent and consequent of a rule.

## Lab#12: Outliers Detection

Date of the Session: \_\_\_\_/\_\_\_\_/\_\_\_\_

Time of the Session: \_\_\_\_ to \_\_\_\_

### Pre-lab:-

1. What do you mean by an outlier? What are the main causes for outliers?
2. What are the important methods for outlier detection?
3. Why is outlier detection necessary in data analysis?
4. How do we calculate z-score?
5. Consider the below dataset which comprises of the income (in thousands) of 15 people in an organisation.  
[45, 51, 63, 48, 67, 48, 56, 2, 62, 59, 44, 61, 99, 46, 52]  
What do you observe from the above data? Is there any significant difference between the incomes of few employees? If so, what could be the reason of it?

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

### In-lab:-

1. The dataset Boston house prices consists of 9 attributes CRIM, ZN, INDUS, LSTAT, NOX, RM, DIS, RAD, TAX. The description of each attribute

- CRIM per capita crime rate by town
- ZN proportion of residential land zoned for lots over 25,000 sq.ft.
- INDUS proportion of non-retail business acres per town
- NOX nitric oxides concentration (parts per 10 million)
- RM average number of room per dwelling
- DIS weighted distances to five Boston employment centres
- RAD index of accessibility to radial highways
- TAX full-value property-tax rate per \$10,000

**Boston dataset:** [https://drive.google.com/file/d/1YVYWQWPKsLXIUM-0XCnGCwDINli7\\_uIv/view?usp=sharing](https://drive.google.com/file/d/1YVYWQWPKsLXIUM-0XCnGCwDINli7_uIv/view?usp=sharing)

- Using boxplot detect which columns have outliers
- Implement scatter plot between INDUS and TAX and inspect the outliers
- Apply z\_score outlier detection method on Boston dataset considering threshold = 3
- Print any five z\_score values of the outliers.
- Remove all the outliers obtained from the dataset and refashion the dataset.
- Apply interquartile range (IQR) outlier detection on the dataset and print IQR values of each column.
- Calculate lower\_bound and upper\_bound and print Boolean values wherein the outliers are represented as TRUE.
- Remove all the outliers produced by interquartile range method and refashion the dataset.

**Writing space of the Problem: (For Student's use only )**

Course Title	Data Warehousing and Mining	ACADEMIC YEAR: 2024-25
Course Code(s)	22AD3104A	Page 64 of 71

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

2. Consider the iris dataset. It includes three iris species with 50 samples each as well as some properties about each flower. The columns in this dataset are:

- Sepal Length Cm
- Sepal Width Cm
- Petal Length Cm
- Petal Width Cm
- Species

<https://drive.google.com/file/d/1HEEMrAQqAynHdM5TmK0G-mD5Qr0OW2J8/view?usp=sharing>

Import the csv file and use the box plot method to visualize the outliers considering the 4 properties of a flower. You will notice that one of the properties has outliers.

1. Considering the range of the outliers from the visualisation, display the observations which have outliers.
2. Implement a DBSCAN model fitting on the dataset taking epsilon value as 0.8 and minimum samples value as 19.
3. Print the counter values using the counter function on the model labels.
4. Considering the values obtained from the model labels print the outliers of the data.
5. Draw a scatter plot between petal length and sepal width to visualise the outliers.

Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

Post-lab:-

Consider the following student dataset  
<https://drive.google.com/file/d/1edmKnHjXkTyHT6qSYhwLw9rTpzoy1Ciq/view?usp=sharing>

Which consists of student details of two schools in a town?

i. Find the students who have taken more number of leaves than the average number of absences by implementing a z\_score function taking mean and standard deviation into account.

ii. Find the number of students who got least and highest score in the subject G1 considering threshold =2.5

iii. Apply box plot for the above two instances.

2. Can we find outliers for categorical values? Explain.

3. A sugar factory weighs every sugar packet in the weighing machine before packing them into cartons. As per the guidelines of the factory, the standard weight of each sugar packet should be 60 grams. It has been observed that during the final weighing of the packets, few of them gave an anomalous weight due to malfunctioning of weighing machines.

Consider the below dataset which comprises of weights of the packets. <https://drive.google.com/file/d/1JkdkQ3j-J93DCfZa3kUjDycEtRzShk6V/view?usp=sharing>

a. Find those anomalous weights by plotting a histogram

b. In the range 0 to 1, consider the lower\_bound = 0.1 & upper\_bound = 0.9 and find the outliers using the quantile method.

c. Segregate the outliers from in lines using “loc” method to get the values of “true\_index”. Also obtain values of “false\_index”.

d. Now find the median from the values obtained in “true\_index”

e. Replace all the outliers with median.

Experiment #	<TO BE FILLED BY STUDENT>	Student ID	<TO BE FILLED BY STUDENT>
Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

VivaVoce:-

1. Is it good to remove an outlier from the dataset all the time?
2. What the applications of outlier detection.
3. What the different types of outliers?
4. Are outliers just side products of some clustering algorithms?
5. What is the difference between noise and anomaly?
